Connecting Your Waterline to Your Pump

Covington's pumps are easy to connect to any machine. The pump has a black threaded adapter that must first be threaded into the top of the pump. There is also a quick connect adapter included which threads onto the black adapter. Press the 1/4" tubing into the quick connect adapter and pull back gently to secure the tubing in place. Simply place the pump into a bucket of water and it is ready to use. See Picture 1.

Connecting Your Waterline to Your Machine

Covington manifolds feature quick connect adapters. To install the waterline, simply insert the line into the adapter completely then pull back gently to secure the tubing. To install the waterline into a brass valve, place the valve nut and ferrule over the tubing and insert the brass insert. Press the tubing into the valve and cinch down the nut with a wrench. See Picture 2.
